

Normalize Confluence Download URLs for WGET

Attachment Download for Confluence

Without this, I was downloading files like `xymon.zip?1234123=asdpmac` etc etc, now its exactly what I want! `wget url/xymon.zip` and the file stays the same on the CLI so I can script its installation!

Note: After testing, it appears that if I download a linked file from the Confluence site, it still has a weird URL. What I need to do is download the file via the Scroll ViewPort then copy that link back into the article and it works via Wget.
