

Change Ubuntu Desktop ESXi guest resolution via CLI

I noticed that the Apply button to change the desktop resolution via GUI was out of the screen.... great. This is why I still use Windows as my main GUI os, but love linux for a server. But I still keep Ubuntu Desktop around.

Anyway long story short.

You can use just: [To view possible outputs] but I wouldn't be suprised it it was always the same seeing as its virtual. So the below command is probably what you want.

```
xrandr
```

```
xrandr --output Virtual1 --mode 1366x768
```

```
alias displaysize="xrandr --output Virtual1 --mode 1360x768"
```
